

FIRE WARNING

- Although BLACK plastic Superchute sections are Fire Retardant and pass the UL94V-0 test, the debris in the roll-off container may be flammable.
- In the event of a container fire even a fire retardant chute will quickly spread smoke and fire throughout the building.
- Follow these fire prevention measures:
 1. Study the fire prevention plan for the chute system at your jobsite.
 2. Spray water into the container to keep flammable debris wet (wood, shingles, paper, etc).
 3. Do not smoke, weld, or use an open flame within 20 feet of the chute or container.
 4. Ensure that there is a water hose or fire extinguisher on every floor level facing the chute.
 5. Post “Danger - Flammable Materials” signs around the container and on levels facing the chute.
