

FIRE WARNING

- Blue plastic chute sections are flammable, and debris in the roll-off container may be flammable.
- A fire in the container will ignite a chute. Any chute, even one made of fireproof material, will quickly spread fire and smoke throughout the building.
- Follow these fire prevention measures:
 - 1. Study the fire prevention plan for the chute system at your jobsite.
 - 2. Spray water into the container to keep flammable debris wet (wood, shingles, paper, etc).
 - 3. Do not smoke, weld, or use an open flame within 20 feet of the chute or container.
 - 4. Ensure that there is a water hose or fire extinguisher on every floor level facing the chute.
 - 5. Post "Danger Flammable Materials" signs around the container and on levels facing the chute.
 - 6. Consider using fire retardant Superchute sections, available in black plastic or steel.
