

FIRE WARNING

- Plastic chute sections are flammable, and debris in the roll-off container may be flammable.
- A fire in the container will ignite a chute. Any chute, even one made of fireproof material, will quickly spread fire and smoke throughout the building.
- Follow these fire prevention measures:
 1. Study the fire prevention plan for the chute system at your jobsite.
 2. Spray water into the container to keep flammable debris wet (wood, shingles, paper, etc).
 3. Do not smoke, weld, or use an open flame within 20 feet of the chute or container.
 4. Ensure that there is a water hose or fire extinguisher on every floor level facing the chute.
 5. Post “Danger - Flammable Materials” signs around the container and on levels facing the chute.
 6. Consider using fire retardant Superchute sections, available in black plastic or steel.
